The PCS BHB is the ultimate machine. No other machine on the market offers a solution with as much emphasis on brute force, rigidity and capability. With options ranging from, but not limited to, high speed drilling, tapping, boring, countersinking, milling, cutting, 100% duty cycle plasma cutting, plasma & beveling, plate printing & marking or any combination, all with precision motion control on a 100% dry or wet cutting table - you're possibilities are endless!

WHO IS PROFILE CUTTING SYSTEMS?
Profile Cutting Systems (PCS) was established in 1989 by three highly experienced electronic and mechanical technicians, with a combined total of 100 years expertise in manufacture, service and use of gas cutting, plasma cutting and drilling machines. Now the company is a leading manufacturer of the most advanced profile cutting machines. The 550+ PCS machines can be found on every highly populated continent excluding South America. The departments within PCS and partnered sales agents consist of the only the best personnel in the industry. The PCS research and development team is continually designing and developing new and innovative solutions such as the patented PCS Zero Offset Plasma Bevel Head, PCS Automatic Plate Feed, PCS TurboGas, the PCS BHB series with a 60HP Single Spindle Drill and a 24 tool Automatic Tool Changer.

The machine carriage is an all-welded construction with a wholly fabricated beam that utilizes several design characteristics used within the aerospace industry. Supporting the fabricated beam are ultra solid modular side supports. The drilling process is driven by a 60HP Digital AC Servo motor. Connected to the motor is a BT50 or CAT50 spindle that can handle up to 1395 FT/LB (1890Nm) of torque. The drill assembly is supported on linear rails with the vertical motion also driven by a Digital AC Servo Motor. To ensure that the steel plate remains stationary the BHB utilizes a fabricated clamping mechanism which is controlled by an additional Digital AC Servo motor capable of producing up to 3.3 Ton (3.0 tonnes) of force. To reduce machine downtime the BHB utilizes as standard a 24 Pot Automatic Tool Changer which has a tool change time of 2.5 seconds.

To ensure ultra smooth operation the side supports run on extra-reinforced fabricated rails with a machined billet running surface and vertically adjustable base plates which are adjusted on site to provide a ridged and finely tweaked level running surface. With extra powerful state of the art Digital AC dual drive system and integrated active rail cleaning system, the PCS BHB will perform to the strictest of tolerances for decades to come in a highly demanding industrial environment. As several clients have already confirmed, if you are looking to drastically reduce the lead time on projects that require high speed drilling, cutting and plate edge preparation then the BHB will provide results that cannot be matched. Furthermore one client has stated that, “the PCS BHB has drastically reduced job completion times, from 8 hours to only 2 hours.”

Customizations

- Customized cutting width
- Infinite length
- On-Board Swarf extraction system
- Multiple gantries on common rail
- Plasma cutting
- PCS Zero Offset Plasma Bevel
- Independent torch station select
- Stud welding
- Steel Grade plasma cutting
- Rotary pipe cutting axis
- Flame (Oxy) bevel
- Up to 10 flame (Oxy) torches
- Extra hi-flow gas manifold
- Auto igniters
- Plate cooling rings
- Through tool MQL with high pressure air blast.
- Through tool flood coolant
- Any custom requests

- Paint marking
- Pin marking
- Powder marking
- PCS TurboGas - Automatic gas control for flame (Oxy) cutting
- PCS IntuitiveGas - Automatic height control for flame (Oxy) cutting
- On Table plate stock database
- Job reporting interface for managers
- Advanced maintenance logger
- Travelling dross bin
- Digitally zoned fume extraction
- Automatic plate alignment
- Automatic plate feed
- Extra safety devices
- Operators chair
- Operator safety shield
- Wireless pendant
- PCS designed & manufactured wet or dry cutting tables

Dealing with High-Frequency Electrical Interference?
The plasma cutting process produces extreme levels of high-frequency electrical interference. PCS’s extensive two decades of plasma experience and close relationships with component manufacturers has resulted in premeditated methods to screen, protect and select electrical components. Even the slightest penetration of high-frequency electrical interference can lead too difficult to detect intermittent errors which reduce the cutting quality and productivity.

Installation Charges?
PCS provides installation included with any PCS BHB quotation. Installation costs can equate to thousands of dollars. Many other boutique machines require installation by a third party where by any abnormality in the installation process will ultimately be charged to the end user.

THINGS TO LOOK OUT FOR

Good quality, Durable Rack, Rail and Pinions?
Many cheaper machines utilize smaller or less durable components which work great at first, however these machines are destined to suffer premature wear. Any mechanical backlash or abnormality will guarantee poor quality cutting minute. Furthermore premature wear will result in excessive stress on other components such as motors, belts and drive amplifiers. Many managers have found the initial CapEx advantage of a cheap machine is quickly eroded by the loss of clients seeking better quality cutting and excessive maintenance callouts. Acknowledged managers that consider Arc On Efficiency when determining ROI will always purchase a PCS machine.

Dealing with High-Frequency Electrical Interference?
The plasma cutting process produces extreme levels of high-frequency electrical interference. PCS’s extensive two decades of plasma experience and close relationships with component manufacturers has resulted in premeditated methods to screen, protect and select electrical components. Even the slightest penetration of high-frequency electrical interference can lead too difficult to detect intermittent errors which reduce the cutting quality and productivity.

Engineering and Test Capability?
PCS employ only the very best personnel. In particular, staffs within the mechanical and electrical engineering departments are required to have exceptional qualifications while utilizing cutting edge computer engineering packages. In the design stage, all of the PCS machine models are rigorously tested and calculated through advanced computer modeling. This stage permits both major and fine mechanical adjustments that result in increased longevity achieved by very few manufacturers. Once an unparalleled result is achieved a prototype is produced and put through the harshest of tests, and amendments are made. The final result is a benchmarked machine model that can operate exactly as stated in our quotations with no hidden surprises.

Support?
When buying from PCS you are dealing directly with the manufacturer. PCS stocks an immense array of spare parts and consumables to ensure that machine downtime is kept to a minimum should a breakdown or natural disaster occur. Equally important, PCS directly provides exceptional knowledge and advice. What down time can you expect for any breakdowns and how will this affect your corporate image? Can you trust the machine manufacturer to provide spare parts for years to come?
